

SOFTWARE REQUIREMENTS SPECIFICATION (SRS)

Security Incident Mapping (SIM)

Prepared By

Name: Akinde Akintunde Wisdom

Matric no: 241201089

Course: SEN202

Department: Computer Science

1. Introduction

1.1 Purpose

The Security Incident Mapping (SIM) is a web-based application developed to enable students, staff, and landlords to report security incidents occurring within and around the university community. The system helps improve campus security by providing a centralized platform for reporting and monitoring incidents.

1.2 Objectives

The objectives of the system are:

- Improve campus security.

- Allow users to report incidents quickly.

- Help security officers respond faster.

- Keep records of reported incidents.

Increase awareness of security issues.

2. Scope

The SIM system allows members of the campus community to report incidents such as theft, assault, rape, stabbing, kidnapping, and vandalism. Security officers (administrators) can monitor, manage, and update reports submitted through the system.

3. System Users

Students

Staff

Landlords

Security Administrator

4. Functional Requirements

The system shall:

Allow users to register or log in.

Allow users to report security incidents.

Allow users to enter incident location and description.

Allow administrators to view all reports.

Allow administrators to update incident status.

Allow users to view the status of their reports.

5. Non-Functional Requirements

The system should:

Be easy to use.

Be secure.

Be reliable.

Respond quickly.

Be accessible using phones and computers.

Be available 24 hours a day.

6. System Components

The SIM system consists of:

Frontend

HTML
CSS
Backend (Future Improvement)
PHP
MySQL Database
Users
Students
Staff
Landlords
Administrator

7. Input

The system accepts:

User name
Incident type
Incident location
Incident description

8. Output

The system displays:

Incident successfully reported.
List of reported incidents.
Updated incident status.

9. Assumptions

Users have internet access.
Users provide accurate information.
The administrator regularly monitors reports.

10. Conclusion

The Security Incident Mapping (SIM) system provides a simple and efficient way of reporting and managing campus security incidents. It supports timely reporting, improves communication between users and security personnel, and contributes to a safer campus environment.
